

T-4.2 Adopted Policy on the "Stable to Table" Approach

The production of safe food of animal origin for human and animal consumption should incorporate the principles of the WVA “Stable to Table” approach.

Background

There is a worldwide increase in food borne infections related to the intensification of animal production.

Important food borne diseases are caused by *Salmonella* spp, *E. coli* O157H7, *Vibrio* spp, *Campylobacter jejuni*.

Rapid, non-invasive, detection techniques should be developed for use on the living food animals and food.
